1. Purpose / Scope of application
Detection and quantitative determination of nitrosamine N-nitrosodimethylamine (NDMA) in Valsartan finished products by APCI-UHPLC-MS/MS.

2. Safety instructions
The generally applicable guidelines of the laboratory apply, as well as in addition:

2.1 Workplace instructions
Due to the carcinogenic properties of nitrosamines, all work must be carried out with gloves and under fume cupboard. The workplace instruction for CMR substances must be observed.

2.2 Protective material
2.2.1 Gloves
Sample processing and preparation of standards for calibration:
single use nitrile gloves: StarGuard Comfort.
In case of contamination, change gloves immediately.

Transfer of methanol:
Chemical protection glove: Ansell Barrier

2.3 Minimization- and Substitution-Check
A substitution of the carcinogenic substance N-nitrosodimethylamine is not possible. To minimize the workplace concentration: Nitrosamines are needed as a standard substance. By purchasing reference solutions, the possible risk of contamination is reduced as much as possible.
3 Brief description
The homogenized sample is suspended with methanol, extracted in an ultrasonic bath and
diluted with water. The membrane-filtered sample is separated by ultra-high performance liquid
chromatography (UHPLC) and analyzed by chemical ionization under atmospheric pressure
and tandem mass spectrometry (APCI-UHPLC-MS/MS) in multi-reaction monitoring mode
(MRM). The quantification of NDMA is performed using an isotopic labeled internal standard
according to the internal standard method. The confirmation is provided by the ion ratios of two
mass transitions.

4 Chemicals/materials
4.1 Reference material:

4.4 Required Solutions
4.4.1 LC-MS/MS

Eluent A: 0.1 vol-% formic acid in water
dissolve 1 ml formic acid in 1000 ml ultrapure water

Eluent B: methanol HPLC grade

5 Devices
5.1 LC-MS/MS
- UHPLC-System coupled with a tandem mass spectrometer with APCI source
  (Agilent Infinity 1290 UHPLC + Agilent 6460 APCI-QQQ-MS)
- Column: Waters HSS-T3 100 x 3.0mm 1.8 µm

5.2 Laboratory devices
- brown glass GC-Vials
- syringe attachment filter with 0.20 µm PET membrane
- analytical balance, 0.1mg precision
- vortex mixer
- ultrasonic bath
- 12 - 15 ml centrifuge tubes with plain bottom and screw cap (plastic)
- 5 ml disposable syringes
- different piston and/or direct displacement pipets for volume 3 µl – 10,000 µl
- laboratory glassware (volumetric flask, cylinders, solvent bottles etc.)

6 Procedure Calibration

6.1.1 Stability / Storage

<table>
<thead>

</tr>
</tbody>
</table>

6.1.2 Reference-Substance

Substance is purchased as reference solution (=stock solution):
NDMA: 5000 µg/ml in methanol

Standard solution
From stock solution: 20 µl / 10 ml each with methanol (c = 10 µg/ml)

Calibration solution:
From standard solution: 500 µl / 10 ml with water (c = 500 ng/ml)

6.1.3 ISTD

ISTD stock solution
NDMA-d6: approx. 10 mg / 10 ml with methanol (c = approx. 1000 ng/ml)

ISTD- Solution
From ISTD stock solution: 25 µl / 50 ml each with methanol (c = 500 ng/ml)

6.2 Calibration solutions

6.2.1 Working range from 0.1 ppm until 3.0 ppm

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<td>30</td>
<td>350</td>
<td>300</td>
</tr>
</tbody>
</table>

Concentration of internal standard in each case: approx. 10 ng/ml measuring solution

If applicable the equal concentrated calibration solutions K4, K5 and K6 from working range 0.0 until 3.0 ppm can be used as calibration solutions K1, K2 and K2 for working range 3.0 until 30.0 ppm.

### 6.3 Sample Preparation

#### 6.3.1 Blank value

**Control blank value**

All equipment used for sample preparation and handling, e.g. centrifuge tubes, pipet tips, membrane filters, have to be checked for possible contamination with nitrosamines. Therefore a blank value (blank sample) using all solutions and equipment (i.e. sample preparation according to 6.3. without sample weighing) has to be analyzed. The prepared solution is filled into a vial for the subsequent measurement.

#### 6.3.2 Control sample (quality assurance measure)

As control sample, a sample with NDMA is used:

- approx. 50 mg (± 0.1 mg) homogenized sample (based on the active component = NDMA) are weighed in a plastic centrifuge tube (for material refer to 5.2)
- + 200 µl ISTD solution
- + 300 µl methanol
- mix using the vortex, followed by 5 minutes in the ultrasonic bath
6.3.3 Sample preparation

- Ca. 50 mg (± 0.1 mg) homogenized sample (based on the active component = NDMA) are weighed in a plastic centrifuge tube (for material refer to 5.2)
- + 200 µl ISTD solution
- + 300 µl methanol
- mix with the vortex, followed by 5 minutes in the ultrasonic bath
- add 9.5 ml ultrapure water
- mix again, followed by 5 minutes in the ultrasonic bath
- centrifuge the solution by ultracentrifugation followed by membrane filtration into a GC vial

6.4 Chromatography

The specified parameters are the default parameters for this method:
- Column: HSS-T3 100 x 3.0 mm, 1.8 µm
- Column oven temperature: 30°C
- Injection volume: 20 µl

Elution program (gradient program):

*=Quantifier (in case of interferences, it is also possible to analyze via another precursor ion / product ion pair (transition) )

**Comment:**
- transition m/z 75 - 43 usually has a higher background (noise)

7 Quality assurance procedure
Refer to 6.3.2 control sample.

8 Data interpretation
8.1 Evaluation of the measured data
8.1.1 General
Analysis is carried out by the integration of the peak areas of the respective mass traces and calculation according to the method of internal standard.
8.1.2 Qualifier

At least a second precursor ion / product ion pair (transition) is used to verify the results (qualifier). The relative intensity of the quantifier/qualifier (qualifier ratio) from the calibration measurements is compared to the qualifier ratio of the samples (software determines the intensity ratio and issues the „qualifier ratio“).

The maximum accepted relative ion intensity tolerance is set as follows (taken from the Commission Decision (2002/657/EG) amending Directive 96/23/EG):

\[
\text{Deviation } +/- 20\% \text{ (Qualifier Ratio)}
\]

2.1 Calculation

The NDMA content in the sample is calculated based on the following formula:

\[
NDMA \ [mg/kg] = \frac{X \times DF}{W \times 1000}
\]

\(X\) = ng nitrosamine per ml measuring solution
\(DF\) = dilution factor
\(W\) = sample weight in g

9 Remarks

1. The method is validated for two working ranges (relating to tablet mass, without considering measurement uncertainty):
   - 0.1 – 3.0 ppm
   - 3.0 - 30.0 ppm
2. The limit of quantification (LoQ) of NDMA is 0.2 ppm (working range 0.1 - 3.0 ppm).
3. The limit of detection (LoD) of NDMA is 0.08 ppm (working range 0.1 - 3.0 ppm).
4. If interferences appear further validation can be required.
